INTRODUCTION	1
REVIEW OF LITERATURE	4
MATERIALS AND METHODS	24
EXPERIMENTAL RESULTS	38
1-Isolation, purification, identification and frequency of fungi associated with un-sterilized kernels of two yellow corn hybrids and one female inbred line	38
2- Isolation, purification, identification and frequency of fungi associated with sterilized kernels of two yellow corn hybrids and one female inbred line	39
Infestation trials	43
1- Seed infestation	43
A- Effect of seed infestation of yellow corn hybrids (SC- 3062 and DC-Dahab) with some *Fusarium* species on infection percentage	43
B- Chemical determinations	44
1-Determination of total protein in infested yellow corn seeds (DC-Dahab & SC-3062) with *Fusarium* spp at different moisture contents	44
2-Determination of total carbohydrates in infested yellow corn seeds (DC-Dahab & SC-3062) with *Fusarium* spp at different moisture contents	46
3- Determination of total oils in infested yellow corn seeds (DC-Dahab & SC-3062) with *Fusarium* spp at different moisture contents	49
C- **Determination of Mycotoxin**	51
- Determination of fumonisins mycotoxins (µg/g) in infested corn grains with *Fusarium* spp. at different moisture content levels	[illegible]
- Electrophoretic analysis of protein patterns of two yellow corn hybrids (DC-Dahab and SC-3062) and one female inbred line (FIL-X)	[illegible]
2- Soil infestation	54
3- Ear infestation	57
Location of *Fusarium moniliforme* in seed parts	62
Control trials	63
1- Effect of seeds disinfection of yellow corn hybrids using fungicides for controlling *Fusarium moniliforme* the causal agent kernel rots	[illegible]
2- Effect of hot water treatments on seed germination and infection % of *F. moniliforme* the causal agent of kernel rots of yellow corn hybrids	[illegible]
3- Effect of storage of dressed corn seeds with different fungicides on germination and infection % with kernel rot pathogens at room temperature (25-30°C) and at 8°C	[illegible]
