Three-phase Circuits
Unbalanced 3-phase systems
Power in 3-phase system
UNBALANCED DELTA-CONNECTED LOAD

The line currents will not be equal nor will they have a 120° phase difference as was the case with balanced loads.

Example 4.

A three-phase, three-wire, 240 volt, ABC system has a delta-connected load with \( Z_{AB} = 10/0° \), \( Z_{BC} = 10/30° \) and \( Z_{CA} = 15/-30° \). Obtain the three line currents and draw the phasor diagram.

\[
I_{AB} = \frac{V_{AB}}{Z_{AB}} = \frac{240/120°}{10/0°} = 24/120°
\]
\[
I_{BC} = \frac{V_{BC}}{Z_{BC}} = 24/-30°
\]
\[
I_{CA} = \frac{V_{CA}}{Z_{CA}} = 16/270°
\]

Apply Kirchhoff's current law to the junctions

\[
I_A = I_{AB} + I_{AC} = 24/120° - 16/270° = 38.7/108.1°
\]
\[
I_B = I_{BA} + I_{BC} = -24/120° + 24/-30° = 46.4/-45°
\]
\[
I_C = I_{CA} + I_{CB} = 16/270° - 24/-30° = 21.2/190.9°
\]

The corresponding phasor diagram is shown in Fig.
On a four-wire system the neutral conductor will carry a current when the load is unbalanced.

The voltage across each of the load impedances remains fixed with the same magnitude as the line to neutral voltage.

The line currents are unequal and do not have a 120° phase difference.

Example 5.

A three-phase, four-wire, 208 volt, CBA system has a wye-connected load with \( Z_A = 6/0^\circ \), \( Z_B = 6/30^\circ \) and \( Z_C = 5/45^\circ \). Obtain the three line currents and the neutral current. Draw the phasor diagram.

\[
I_A = \frac{V_{AN}}{Z_A} = \frac{120/-90^\circ}{6/0^\circ} = 20/-90^\circ
\]

\[
I_B = \frac{V_{BN}}{Z_B} = 20/0^\circ \quad I_C = \frac{V_{CN}}{Z_C} = 24/105^\circ
\]

\[
I_N = -(I_A + I_B + I_C) = -(20/-90^\circ + 20/0^\circ + 24/105^\circ) = 14.1/-166.9^\circ
\]
UNBALANCED THREE-WIRE, WYE-CONNECTED LOAD

- The common point of the three load impedances is not at the potential of the neutral and is marked "O" instead of N.
- The voltages across the three impedances can vary considerably from line to neutral magnitude, as shown by the voltage triangle which relates all of the voltages in the circuit.

Example 6.

A three-phase, three-wire, 208 volt, CBA system has a wye-connected load with $Z_A = 6/0^\circ$, $Z_B = 6/30^\circ$ and $Z_C = 5/45^\circ$. Obtain the line currents and the phasor voltage across each impedance. Construct the voltage triangle and determine the displacement neutral voltage, $V_{ON}$.

- Draw the circuit diagram and select mesh currents as shown in Fig.
- Write the corresponding matrix equations (Cramer Rule)
UNBALANCED THREE-WIRE, WYE-CONNECTED LOAD

\[
\begin{bmatrix}
6/0^\circ + 6/30^\circ & -6/30^\circ \\
-6/30^\circ & 6/30^\circ + 5/45^\circ
\end{bmatrix}
\begin{bmatrix}
I_1 \\
I_2
\end{bmatrix}
= 
\begin{bmatrix}
208/240^\circ \\
208/0^\circ
\end{bmatrix}
\]

\[
I_1 = 23.3/261.1^\circ \\
I_2 = 26.5/-63.4^\circ
\]

\[
I_A = I_1 = 23.3/261.1^\circ
\]

\[
I_B = I_2 - I_1 = 26.5/-63.4^\circ - 23.3/261.1^\circ = 15.45/-2.5^\circ
\]

\[
I_C = -I_2 = 26.5/116.6^\circ
\]

Now the voltages across the three impedances are given by the products of the line currents and the corresponding impedances.

\[
V_{AO} = I_A Z_A = 23.3/261.1^\circ (6/0^\circ) = 139.8/261.1^\circ
\]

\[
V_{BO} = I_B Z_B = 15.45/-2.5^\circ (6/30^\circ) = 92.7/27.5^\circ
\]

\[
V_{CO} = I_C Z_C = 26.5/116.6^\circ (5/45^\circ) = 132.5/161.6^\circ
\]

\[
V_{ON} = V_{OA} + V_{AN} = -139.8/261.1^\circ + 120/-90^\circ = 28.1/39.8^\circ
\]

\[
V_{ON} = \frac{V_{AN} Y_A + V_{BN} Y_B + V_{CN} Y_C}{Y_A + Y_B + Y_C}
\]
POWER IN BALANCED THREE-PHASE LOADS

Since the phase impedances of balanced wye or delta loads contain equal currents, the phase power is one-third of the total power.

- The voltage across is line voltage
- The current is phase current.
- The angle between $V$ & $I$ is the angle on the impedance.

\[ \text{Phase power} \quad P_P = V_L I_P \cos \theta \]
\[ \text{Total power} \quad P_T = 3 V_L I_P \cos \theta \]

For a balanced $\Delta$-connected loads:

\[ I_L = \sqrt{3} I_P \]
\[ P_T = \sqrt{3} V_L I_L \cos \theta \]

- The voltage across is phase voltage
- The current is line current.
- The angle between $V$ & $I$ is the angle on the impedance.

\[ \text{Phase power} \quad P_P = V_P I_L \cos \theta \]
\[ \text{Total power} \quad P_T = 3 V_P I_L \cos \theta \]

For a balanced $Y$-connected loads:

\[ V_L = \sqrt{3} V_P \]
\[ P_T = \sqrt{3} V_L I_L \cos \theta \]
POWER IN BALANCED THREE-PHASE LOADS

\[ P_T = \sqrt{3} V_L I_L \cos \theta \]

\[ S_T = \sqrt{3} V_L I_L \]

\[ Q_T = \sqrt{3} V_L I_L \sin \theta \]
INSTANTANEOUS THREE-PHASE POWER

Remember:

The instantaneous Single-phase power

\[ p(t) = v(t) \cdot i(t) = V_0 \cdot \cos(w \cdot t + \varphi_v) \cdot I_0 \cdot \cos(w t + \varphi_l) \]

\[ \cos A \cdot \cos B = 0.5 \cdot [\cos(A+B) + \cos(A-B)] \]

\[ p(t) = \frac{1}{2} V_0 I_0 \cos(\varphi_v - \varphi_l) + \frac{1}{2} V_0 I_0 \cos(2wt + \varphi_v + \varphi_l) \text{ watt} \]

Constant \hspace{1cm} Oscillates at twice the mains frequency!

---

Graphs showing \( v(t) \), \( i(t) \), and \( p(t) \) with an illustration of the AC circuit. The average power is indicated as \( P \).
The instantaneous 3-phase power

\[ p(t) = V_{AN} I_a + V_{BN} I_b + V_{CN} I_C \]

\[ = \sqrt{2}V_p \cdot \cos(wt + \phi_v) \cdot \sqrt{2}I \cdot \cos(wt + \phi_i) \]
\[ + \sqrt{2}V_p \cdot \cos(wt -120^\circ + \phi_v) \cdot \sqrt{2}I \cdot \cos(wt -120^\circ + \phi_i) \]
\[ + \sqrt{2}V_p \cdot \cos(wt +120^\circ + \phi_v) \cdot \sqrt{2}I \cdot \cos(wt +120^\circ + \phi_i) \]

Assignment:
Complete the steps:
(mathematically/Using Multisim/using Matlab)
to find the instantaneous 3-phase power
POWER LOSSES: THREE-PHASE/SINGLE PHASE

Single-phase line

\[ I = \frac{P_{\text{load}}}{V \cdot \cos \varphi} \]

\[ P_{\text{losses}} = 2 \cdot R_1 \cdot I^2 = 2 \cdot R_1 \cdot \frac{P_{\text{load}}^2}{V^2 \cdot \cos^2 \varphi} \]

Three-phase line

\[ I = \frac{P_{\text{load}}}{\sqrt{3} \cdot V \cdot \cos \varphi} \]

\[ P_{\text{losses}} = 3 \cdot R_2 \cdot I^2 = 3 \cdot R_2 \cdot \frac{P_{\text{load}}^2}{(\sqrt{3})^2 \cdot V^2 \cdot \cos^2 \varphi} = R_2 \cdot \frac{P_{\text{load}}^2}{V^2 \cdot \cos^2 \varphi} \]

Supposing same losses

\[ 2R_1 = R_2 \rightarrow 2 \rho \frac{l}{S_{1p}} = \rho \frac{l}{S_{3p}} \rightarrow S_{3p} = \frac{1}{2} S_{1p} \]

Single-phase line: 2 conductors of length \( l \) and section \( S_{1p} \)
Three-phase line: 3 conductors of length \( l \) and section \( S_{3p} = 1/2 S_{1p} \)

As a result: weight\(_{3p}\)-cables = \(3/4\) weight\(_{1p}\)-cables

\[ \frac{V_{3p}}{V_{1p}} = \frac{3 \ast (l \ast S_{3p})}{2 \ast (l \ast S_{1p})} = \frac{3 \ast (S_{1p}/2)}{2 \ast (S_{1p})} = \frac{3}{4} \]
