ACKNOWLEDGMENT	
INTRODUCTION -----	1
REVIEW OF LITERATURE -----	3
I. Introduction -----	3
II. Wilting as a pre-ensiling necessity -----	3
III. Wilting and silage quality -----	5
IV. Crop residues as forage conditioners for ensiling -----	6
V. Assessing silage quality parameters -----	6
1. Changes in natural characteristics -----	6
2. Volatile fatty acids as quality component of silage--	8
3. Judging silage quality using pH parameter -----	10
4. Other parameters for characterizing silage quality---	11
5. Standards of fodder beet silage -----	12
GENERAL MATERIAL AND METHODS -----	13
I. Standard preparations and chemical pre-ensiling conditioning -----	13
II. Pre-ensiling operations -----	13
III. Ensiling procedures -----	15
IV. The studied silage characteristics -----	16
1. Weight of fodder beet silage -----	16
2. Weight of the effluent -----	16
3. The natural characteristics of the ensiled beet-slices	
a- Colour -----	16
b- Smell and odor -----	16
c- Texture -----	16
d- Foaming -----	16
4. pH value -----	16
5. Chemical determinations of the silage constituents---	17
a- Dry matter -----	17
b- Crude protein -----	17
c- Crude fiber -----	17
d- Total fats -----	17
e- Total sugars -----	17
6. Volatile fatty acids determination -----	18
7. Statistical analysis, and the analysis of variance --	19

CONTENTS (Cont'd)

	Page
FIRST STUDY	
FODDER BEET SILAGE AS AFFECTED BY CULTIVAR AND POTASSIUM BISULFATE TREATMENT.	
MATERIAL AND METHODS -----	20
RESULTS AND DISCUSSION -----	22
1. Natural characteristics -----	22
2. Respiratory-fermentation loss, effluent loss, and net silage weight -----	26
A- Respiratory-fermentation loss -----	26
A-1. Effect of pre-ensiling treatments and cultivars--	26
A-2. Effect of cultivar, location and interaction ----	29
B- Effluent loss -----	29
B-1. Effect of pre-ensiling treatments and cultivars--	29
B-2. Effect of cultivar, location, and interaction. ---	32
C- Net silage weight -----	32
C-1. Effect of pre-ensiling treatments and cultivars--	33
C-2. Effect of cultivar, location, and interaction----	35
D- Correlations -----	35
3. The pH-value, dry matter, and total sugars -----	35
A- pH-values -----	35
A-1. Effect of pre-ensiling treatments and cultivars--	35
A-2. Effect of cultivar, location and interaction ----	38
B- Dry matter -----	38
B-1. Effect of pre-ensiling treatments and cultivars--	38
B-2. Effect of cultivar, location, and interaction----	41
C- Total sugars -----	41
C-1. Effect of pre-ensiling treatments and cultivars--	41
C-2. Effect of cultivar, location, and interaction----	42
D- Correlations -----	43
4. Crude protein, crude fiber, and total fats -----	43
4.1. Effect of pre-ensiling treatments and cultivars -----	43
4.2. Effect of cultivar, location, and interaction -----	45
5. Volatile fatty acids -----	47
6. Possible correlations between the studied characteristics of fodder beet silage. -----	52
7. Estimated quality values of fodder beet silage using the linear regression equation. -----	52

SECOND STUDY	
PERIODICAL MONITORING OF FODDER BEET SILAGE CHARACTERISTICS.	
MATERIAL AND METHODS -----	55
RESULTS AND DISCUSSION -----	57
1. Nutural characteristics -----	57
2. Respiratory-fermentation loss, effluent loss, and net silage weight -----	60
A- Respiratory-fermentation loss-----	60
B- Effluent loss -----	62
C- Net silage weight -----	63
D- Correlations -----	64
3. The pH, dry matter and total sugars -----	65
A- pH-values -----	65
B- Dry matter -----	68
C- Total sugars -----	70
D- Correlations -----	71
4. Crude protein, crude fiber and total fats -----	71
5. Possible correlations between the studied characteristics of fodder beet silage -----	75
THIRD STUDY	
EFFECT OF VARIOUS CONDITIONING TREATMENTS FOR THREE FODDER BEET CULTIVARS ON SILAGE QUALITY	
MATERIAL AND METHODS -----	76
RESULTS AND DISCUSSION -----	80
1. Effluent loss -----	80
2. Net silage weight -----	83
3. pH-values -----	86
4. Dry matter -----	86
5. Total sugars -----	90
6. Crude protein -----	94
7. Crude fiber -----	97
8. Total fats -----	99
9. Possible correlations between the studied characteristics of fodder beet silage -----	99

CONTENTS (Cont'd)

FOURTH STUDY	
EFFECT OF FODDER BEET CULTIVARS AND SOME FERTILIZER TREATMENTS ON SILAGE MAKING.	
MATERIAL AND METHODS -----	103
RESULTS AND DISCUSSION -----	105
1. Natural characteristics -----	105
2. Respiratory-fermentation loss, effluent loss, and net silage weight -----	109
A- Respiratory-fermentation loss -----	109
B- Effluent loss -----	112
C- Net silage weight -----	115
D- Effect of pre-ensiling conditioning -----	118
E- Correlations -----	120
3. The pH, dry matter, and total sugars -----	120
A- pH-values -----	120
B- Dry matter -----	123
C- Total sugars -----	126
D- Effect of pre-ensiling conditioning -----	128
E- Correlations -----	131
4. Crude protein, crude fiber, and total fats -----	132
A- Crude protein -----	132
B- Crude fiber -----	134
C- Total fats -----	136
D- Effect of pre-ensiling conditioning -----	136
E- Correlations -----	138
5. Volatile fatty acids -----	140
6. Possible correlations between the studied characteristics of fodder beet silage -----	146
SUMMARY -----	150
LITERATURE CITED -----	162
APPENDIX -----	170
ARABIC SUMMARY.
