

CONTENTS

	Page
I Introduction.....	1
II Review of Literature	3
II.1. Uses of remote sensing in agriculture	3
II.2. Uses of remote sensing in detection of crop insect pests and diseases	5
II.3. Remote sensing technique by using nonphotographic sensors	9
II.4. Types of systems	10
II.4.1. Radar imaging	10
II.4.1.1. The use of radar for insect detection	16
II.4.2. Passive-microwave imaging	19
II.4.3. Infrared imaging	20
II.4.3.1. Basic radiation principles	21
II.4.3.2. Atmospheric effects on infrared radiation ..	21
II.4.3.3. Infrared detection and recording	22
II.4.3.4. The use of infrared aerial color photography for insect detection	24
II.4.4. Visible imaging " Nonphotographic "	29
II.4.5. Ultraviolet imaging	31
II.4.5.1. Radiation phenomena	31
II.5. Some methods for determining and controlling cotton pests	35
III Materials and Methods	38
III.1. Rearing of tested insects	38

	Page
III.1.1. The cotton leaf worm	38
III.1.2. The greasy cutworm	38
III.1.3. The desert locust	39
III.1.4. Sources of other tested insects	39
III.1.4.1. The pink and spiny bollworms	39
III.1.4.2. The cottony-cushion scale	40
III.1.4.3. The purple scale	40
III.2. The equipments used	40
III.3. Insects detection	42
III.3.1. The relation between the degree of infestation and radiated temperature	42
A. External infestation	42
B. Internal infestation	44
III.3.2. The relationship between weight, volume of cotton bolls and infestation	44
IV Results	47
IV.1. Determination of leaf worm infestation by thermovision camera	47
IV.2. The relationship between weight, volume of cotton bolls and infestation	83
Discussion	93
V.1 Remote sensing technique to determine the degree of infestation	93
