

CONTENTS

1. INTRODUCTION	1
2. REVIEW OF LITERATURE	5
2.1. High-Solid Wastes	5
2.2. Microbiology of Anaerobic Fermentation	6
2.3. Dry Anaerobic Fermentation Process	8
2.4. Developed Dry Anaerobic Fermentation Processes	14
2.4.1. Dranco process	14
2.4.2. KWU-Fresenius process	16
2.4.3. The Valorga process	16
2.4.4. BIOCEL process	17
2.4.5. The SEBAC process	19
2.4.6. The HIG process	19
2.4.7. Controlled landfilling process	21
2.5. Two stage fermentation system	22
2.6. Factors Affecting the Anaerobic process	25
2.6.1. Moisture content, buffer and nutrients addition	25
2.6.2. Temperature	28
2.6.3. Inoculum	30
2.6.4. Pretreatment	32
3. MATERIALS AND METHODS	36
3.1. MATERIALS	36
3.2. Experimental procedures	39
3.2.1. Effect of partial composting on dry anaerobic fermentation of municipal solid waste	39
3.2.2. Dry anaerobic fermentation of municipal solid waste using two phase fermentation process	41
3.2.3. Effect of total solid concentration, bacterial inoculum and application of CaCO_3 on dry anaerobic fermentation of municipal solid waste	42
3.2.4. Methane production from high solid wastes as affected by leachate recycling	42
3.2.5. Dry anaerobic fermentation of farm wastes .	44
3.3. METHODS	
3.3.1. Gas determinations	45
3.3.2. Chemical analysis	46
3.3.3. Microbiological determinations	48
4. RESULTS AND DISCUSSION	52
4.1. Effect of Partial Composting on Dry Anaerobic	

Fermentation of Municipal Solid Waste	52
4.1.1. Yields of biogas and methane	52
4.1.2. Microbiological changes during aerobic pretreatment and after anaerobic fermentation	65
4.1.2.1. Total bacterial count	65
4.1.2.2. Cellulose decomposers	65
4.1.2.3. Acid producing bacteria	68
4.1.2.4. Survival of pathogenic bacteria ..	69
4.1.3. Chemical changes during aerobic and anaerobic fermentation	71
4.1.3.1. Volatile fatty acids and pH	71
4.1.3.2. Ammoniacal nitrogen	74
4.1.3.3. Total nitrogen	75
4.1.3.4. Total phosphorus and potassium ...	77
4.1.3.5. Total and volatile solids	80
4.2. Dry Anaerobic Fermentation of Municipal Solid Waste Using Two Phase Process	83
4.2.1. Biogas produced and its components	83
4.2.2. Microbiological changes during fermentation process	91
4.2.3. Chemical changes during the fermentation process of MSW	95
4.2.4. Biogas production efficiency	103
4.2.5. Evaluation of the endproduct as a biogas manure	106
4.3. Effect of Total Solids Concentration, Bacterial Inoculum and Application of CaCO_3 on Dry Anaerobic Fermentation of Municipal Solids Wastes	110
4.3.1. Biogas and methane production	110
4.3.2. Changes of total and volatile solids	121
4.3.3. Biogas and methane production rates	123
4.3.4. Total nitrogen balance	123
4.3.5. Quality and evaluation of the digested wastes (The final endproduct).....	125
4.4. Methane Production From High Solid Wastes as Affected by Leachate Recycling	129
4.4.1. Biogas production	129
4.4.2. Chemical changes in the recycled leachate.	134
4.4.3. Microbiological changes in the recycled leachate	143
4.4.4. Chemical properties of the final digested wastes (The endproduct)	149
4.5. Dry Anaerobic Fermentation of Farm Wastes	152
4.5.1. Biogas production	152
4.5.2. Methane content	164
4.5.3. Chemical changes during the different pretreatments	165

4.5.4. Microbiological changes during the different pretreatments	171
4.5.5. Survival of Coliform group and Salmonella & Shigella during the fermentation process.	179
4.5.6. Nitrogen balance	181
4.5.7. Changes of total and volatile solids	183
4.5.8. Bioconversion efficiency	187
4.5.9. Properties and evaluation of the organic manure after digestion	191
5. SUMMARY	195
6. REFERENCES	207
